

www

- Full form of www is world wide web and it is an advanced finding information system .
- It is being developed very fast.
- www is based on hypertext.
- The concept of the web was perfected at CERN (Conseil Europeen pour la Recherche Nucleaire, or the European Organization for Nuclear Research) in 1992 by a group of researchers which included Tim-Berners lee, the creator of the hyperlink , who is today considered the father of the web or internet.

- A web page is simple text file written in a markup language (called HTML) document , graphical elements, and links to other documents all with the help of tags.
- Beside the links which connect formatted documents to one another, the web uses the HTTP protocol to link documents hosted on distant computer(web servers).
- On the www , documents are identified with a unique address, called a URL.
- A URL look some thing like this:
- <http://www.mywebsite.com/webfolder/home.html>

- Which means, when the user is browsing on the www.
- www can be started by the command www. Then domain name of the website and finish with top level domains .com or .in etc
- Ex. www.mywebsite.com
